WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or more, except for certain cases carded for record only (chiefly venereal disease cases which are treated on a duty status, and deaths which occurred before being "admitted" to hospital or quarters). Admissions designated as "injury" comprise all traumatisms (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications). Bearing in mind that under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties, all other cases are classified as "disease."

Admissions rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), total beds occupied and beds "available vacant".

Unless otherwise specified, normal bed capacity in this report is defined in Par. 36b (1) and (2) of AR40-1080, 10 December 1943, and Par. 14 WD Circular 43, 1 February 1944. This includes the T/O capacity of non-fixed hospitals but excludes convalescent facilities. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

The number of beds "available vacant" is defined as 80% of the total capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. The bed capacity and beds occupied in convalescent facilities are also indicated. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

Because troops in transit and certain small detachments are not required to submit Reports, as well as for other reasons, the total strength of the reporting units as shown on this report has been consistently about four percent under the actual strength of the Army in the Continental United States.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 12 MAY 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

As shown in the chart on page 3, the admission rates from all causes and from disease for the week ending 12 May 1944 continued to decline. Whereas the decrease in the admission rate for each of the previous two weeks had been about 5 percent each week, the current week's decline was only fractional (about 1 percent). Current morbidity from all causes (reported at 602 per year per thousand strength) and from disease (at 535 per thousand) was about 25 percent lower than for the corresponding week of 1943. Morbidity from disease for the current week was the lowest experienced since 1941, being 10 percent below the lowest rate reported during 1943 (in November) and 5 percent below the lowest rate in 1942 (in August).

Morbidity from injury during the current week (at a rate of 67 per thousand) was slightly higher than for the previous week but still at a relatively low level.

Respiratory Causes:

The admission rates from colds, influenza, etc. decreased for the twelfth consecutive week, and for the current week was 127 per thousand or 6 percent below the rate for the preceding week and 40 percent under that for the corresponding week of 1943.

The admission rate from all forms of pneumonia was again reported at 11 per thousand or about 40 percent under that for the corresponding week of 1943.

Common Communicable Diseases:

Morbidity from venereal diseases (excluding cases existing prior to service) increased by about 10 percent to a rate of 32 per thousand; this level of morbidity is the same as for the weeks ending 21 and 28 April - the highest reported so far this year. The number of new cases of measles decreased again for the sixth consecutive week and for the current week was only about one-half as large as during the peak week in the early part of the year. The number of new cases of mumps decreased for the third consecutive week but was only about 20 percent below the peak week. The number of new cases of scarlet fever decreased by about 25 percent and was less than one-half of the number reported in the peak week of this year. The number of new cases of meningitis decreased by about 25 percent to the lowest level reported so far this year. On the other hand the number of new cases of rheumatic fever increased by almost 40 percent from the low number recorded for the previous week to reach a level close to the highest ever reported.

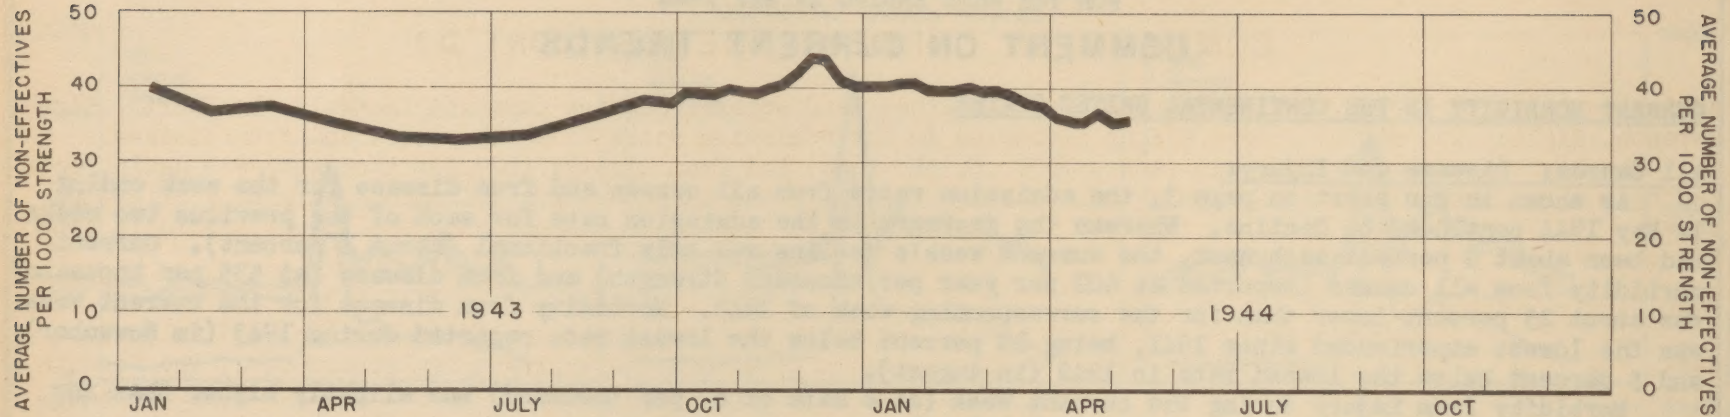

VARIATION IN MORBIDITY BY SERVICE COMMAND

All Causes: Disease and Injury:

Sizable decreases in morbidity from all causes and from disease were registered in the First, Second, and Fifth Service Commands; the lower morbidity in these Service Commands was in large part due to from decreased

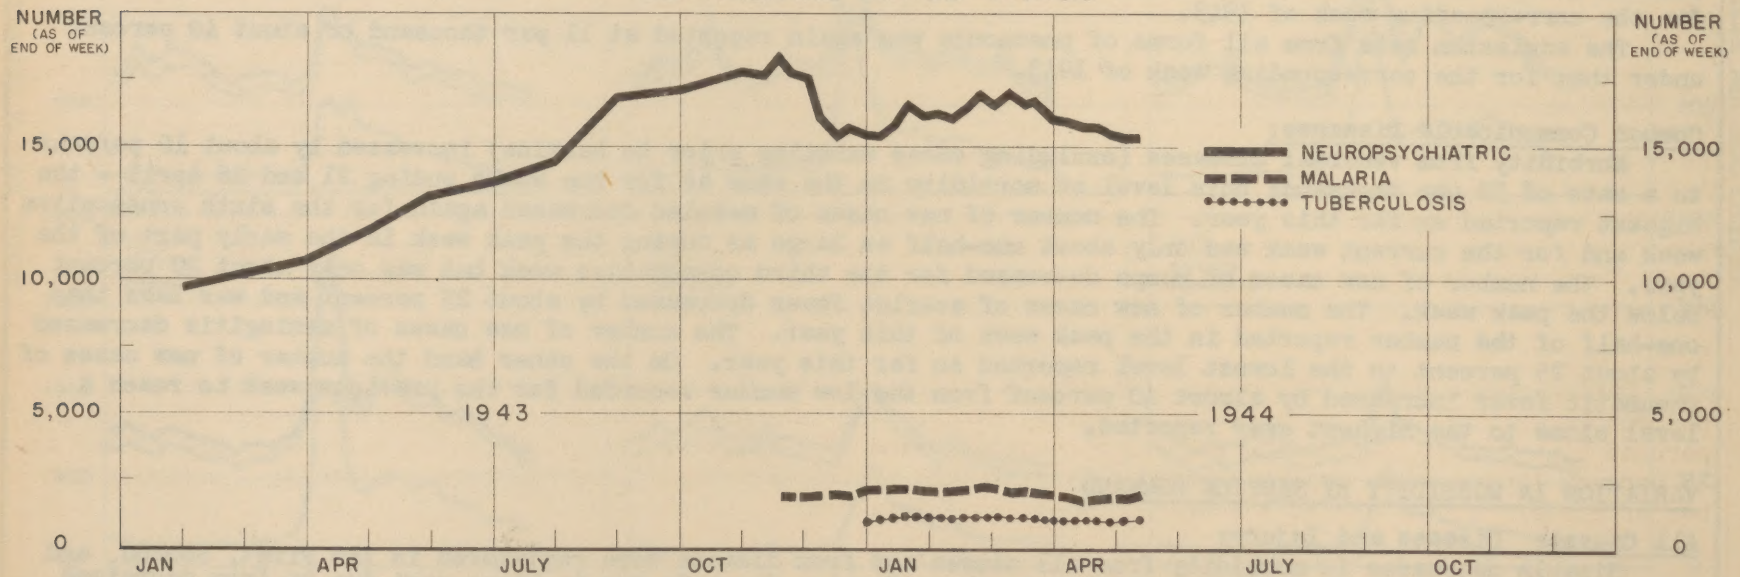

NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

WEEKLY HEALTH REPORT

FOR WEEK ENDING 12 MAY 1944

COMMENT ON CURRENT TRENDS (CONT'D)

admission rates for colds, influenza, etc. On the other hand several Service Commands (notably the Fourth, Sixth, Seventh, Eighth, and Ninth) showed slight increases in the admission rates from all causes and from disease.

The highest morbidity from all causes (677 per thousand) and from disease (629 per thousand) was again reported by the Military District of Washington, although the Sixth and Seventh Service Commands were only slightly lower. The First Service Command displaced the Eighth Service Command as the one with the lowest morbidity from all causes (524 per thousand) and from disease (463 per thousand).

Respiratory Causes:

All Service Commands except the Sixth, Seventh, and Ninth reported lower morbidity from colds, influenza, etc., and even in those three Service Commands the admission rate showed only fractional increases. The Seventh Service Command continued to report the highest admission rate from these causes (204 per thousand), while the lowest rate was again reported by the Fourth Service Command (96 per thousand, which is the first time this year that any Service Command has dropped below a rate of 100 per thousand for this cause).

Morbidity from pneumonia in the Sixth Service Command, which during most of 1944 had been at a level of 30 to 35 per thousand, declined again from the rate of 19 per thousand for the previous week to 17 per thousand for the current week, but remained nonetheless the highest of any Service Command.

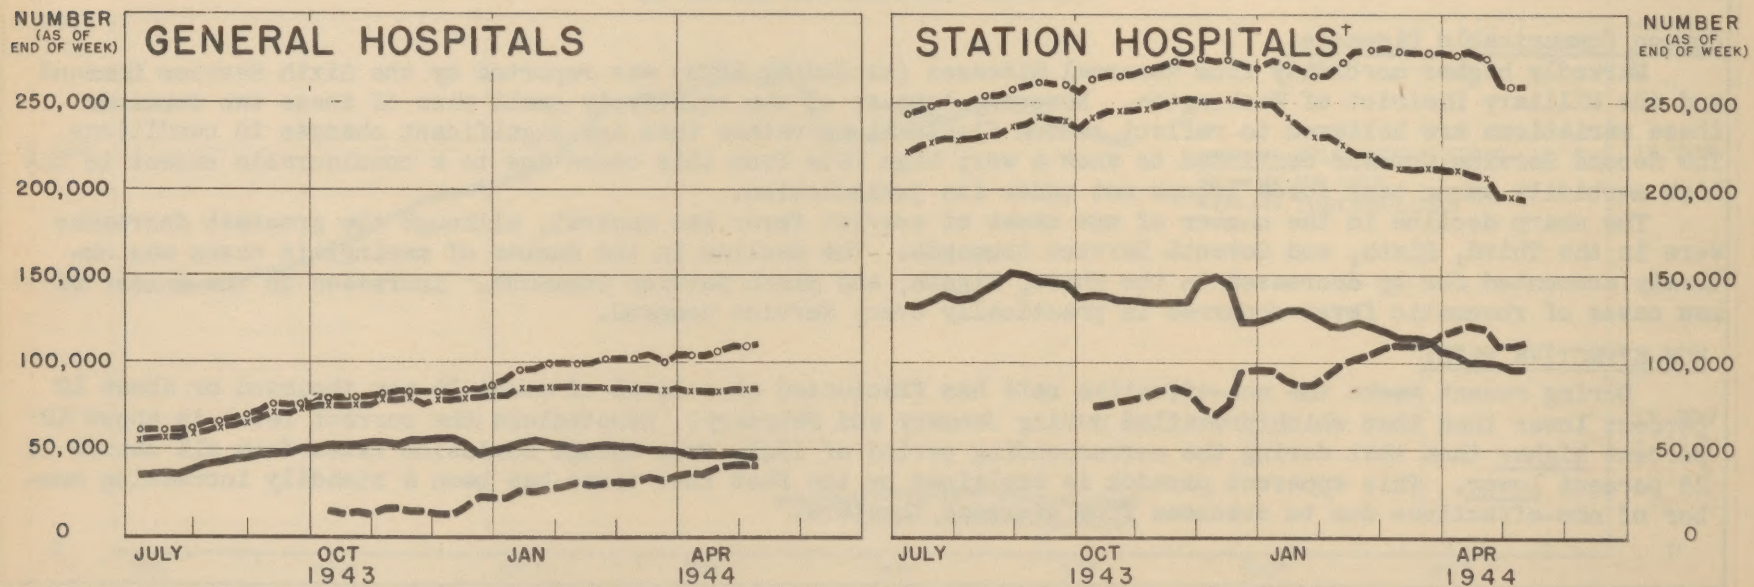

Common Communicable Diseases:

Markedly higher morbidity from venereal diseases (excluding EPTS) was reported by the Sixth Service Command and the Military District of Washington. However, because of the relatively small size of these two Commands these variations are believed to reflect random fluctuations rather than any significant changes in conditions. The Second Service Command continued to show a very high rate from this cause due to a considerable extent to the high morbidity among task force troops not under its jurisdiction.

The sharp decline in the number of new cases of scarlet fever was general, although the greatest decreases were in the Third, Sixth, and Seventh Service Commands. The decline in the number of meningitis cases was entirely accounted for by decreases in the Third, Eighth, and Ninth Service Commands. Increases in the number of new cases of rheumatic fever occurred in practically every Service Command.

NON-EFFECTIVE RATE:

During recent weeks the non-effective rate has fluctuated at a level of about 36 per thousand or about 10 percent lower than that which prevailed during January and February. Nonetheless the current level is about 10 percent higher than that during the corresponding period of 1943, even though admission rates from all causes is 25 percent lower. This apparent paradox is explained by the fact that there has been a steadily increasing number of non-effectives due to evacuees from overseas theaters.

ARMY SERVICE FORCES, OFFICE OF THE SURGEON GENERAL
MEDICAL STATISTICS DIVISION, HEALTH REPORTS BRANCH

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 12 MAY 1944

COMMENT ON CURRENT TRENDS (CONT'D)

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week continued at about 35 per thousand strength. Thus far in 1944 the number of neuropsychiatric cases remaining has fluctuated in the range from 15,300 to 17,000 and for the week ending 12 May 1944 was reported at 15,362 or slightly above the number for the previous week which was the lowest reported since May 1943. The number of malaria cases under treatment has increased steadily in recent weeks from a low of 1,748 on 14 April to 1,923 on 12 May 1944; only 28 of these cases presumably were acquired in the United States. The number of tuberculosis cases remaining under treatment was reported at 1,107 as of 12 May 1944; the increase of 36 over last week was the result of almost 100 cases evacuated from overseas to Halloran G. H..

CURRENT HOSPITAL CONDITIONS:

The total bed capacity as of 12 May 1944 was reported at about 368,000 or about 1,000 more than at the end of the previous week. The number of beds occupied decreased to 143,000 or 1,000 less than at the end of the preceding week, while the number of "available vacant" beds increased to 152,000. Total beds occupied represented 39 percent of total bed capacity. There were 7 stations with bed capacity of about 3,700 having no "available vacant" beds; one General Hospital with a bed capacity of about 1,000 was included among them.

The number of normal beds remained about the same as in the previous week at about 280,000 or 76 percent of the total bed capacity. Included in the normal bed capacity on 12 May 1944 were 660 T/O hospital beds and tentage, while the total bed capacity included 740 such beds, of which 155 were occupied.

The total bed capacity of General Hospitals, which has shown a steady increase in recent months, was reported at about 109,000 as of 12 May 1944, the highest figure so far attained. On the same date about 46,000 of these beds (or 42 percent) were occupied. The "available vacant" beds at General Hospitals numbered 41,000 as of 12 May 1944. Normal beds at General Hospitals have been maintained at a level of about 85,000 since the beginning of the year.

The total bed capacity of Station Hospitals (including the relatively small number of T/O hospital beds and tentage mentioned above) continued at the 259,000 beds reported as of 5 May 1944. Normal beds in these hospitals remained at about 195,000 as of 12 May 1944. Total beds occupied as of 12 May 1944 numbered 97,000 (or 37 percent of the corresponding total bed capacity) which is the lowest level reported during 1943 and 1944 to date. Station Hospitals had 111,000 "available vacant" beds as of 12 May 1944.

As of 12 May 1944 the bed capacity of convalescent facilities in General Hospitals numbered 13,939 beds of which 4,216 beds (or 30 percent) were occupied. The increase of about 3,000 in bed capacity was entirely the result of the setting-up of a 3,000 bed convalescent facilities at Wakeman G. H..

SUPPLEMENTARY HEALTH REPORT

FOR THE FIVE WEEK PERIOD ENDING 31 MARCH 1944

VENEREAL DISEASE ADMISSION RATES

This Supplementary Health Report presents a study of the venereal disease admission rates during the five week period ending 31 March 1944 by color. This study has been confined to the stations with the larger colored strengths, since rates for colored males at stations with less than 1000 colored strength would be based on relatively few cases and thus might have little significance.

For each station having colored male strength of 1000 or over rates have been computed for total Army personnel, for colored males, and for the remainder of the strength of the station. Estimated admission rates for the United States as a whole have also been derived.

The colored male strength at the selected stations represents about 75% of the total colored strength in the United States. On the other hand, the strength of "all other" Army personnel included at the selected stations accounted for only about 40% of the total such strength for the entire country.

In considering venereal disease morbidity during March, reference should be had to the Supplementary Health Report contained in Weekly Health Report No. 16, in which venereal disease admission rates for individual stations (total Army personnel) are shown. In addition, on page 38 of that report there are set forth the number of cases remaining under treatment at the end of the month in each Service Command. The total venereal cases remaining under treatment

represented 2.8% of the total of all cases remaining under treatment, and on this basis accounted for a noneffective rate of about 1.1 per thousand strength.

For total Army personnel morbidity from venereal disease excluding EPTS cases was at a rate of 28.5 per thousand in March. The corresponding rate for colored males was 137 per thousand, while for "all other" Army personnel the rate was 19.1 per thousand. Thus, the morbidity from this cause for colored males was seven times as high as for the remainder of the Army.

Considering the specific diagnoses of the venereal excluding EPTS cases, the syphilis rate for colored males was 14 times as high as for the remainder of the Army, but for gonorrhea the colored male experience was only about 5 times as high. Other venereal diseases were practically all found among colored males who accounted for almost 90% of such cases, although comprising less than 10% of the total strength of the Army; the admission rate from "other" venereal diseases excluding EPTS cases was 15.6 per thousand for colored males and only .2 per thousand for the remainder of the Army.

Morbidity represented by venereal EPTS cases (predominately syphilis) was reported at 18 per thousand for the total Army personnel with corresponding rates of 162 and 5 per thousand for colored males and the remainder of the Army respectively. Variation in the admission rate for venereal EPTS cases reflects entirely the experience among current inductees. As

SUPPLEMENTARY HEALTH REPORT

FOR THE FIVE WEEK PERIOD ENDING 31 MARCH 1944

VENEREAL DISEASE ADMISSION RATES (CONT'D)

a result, variations between Service Commands or individual stations have little significance because they reflect a different geographical distribution of Army personnel as compared with that of new inductees and varying administrative practices. Quite obviously induction centers have very high rates from this cause, whereas other stations show no cases at all or very low rates.

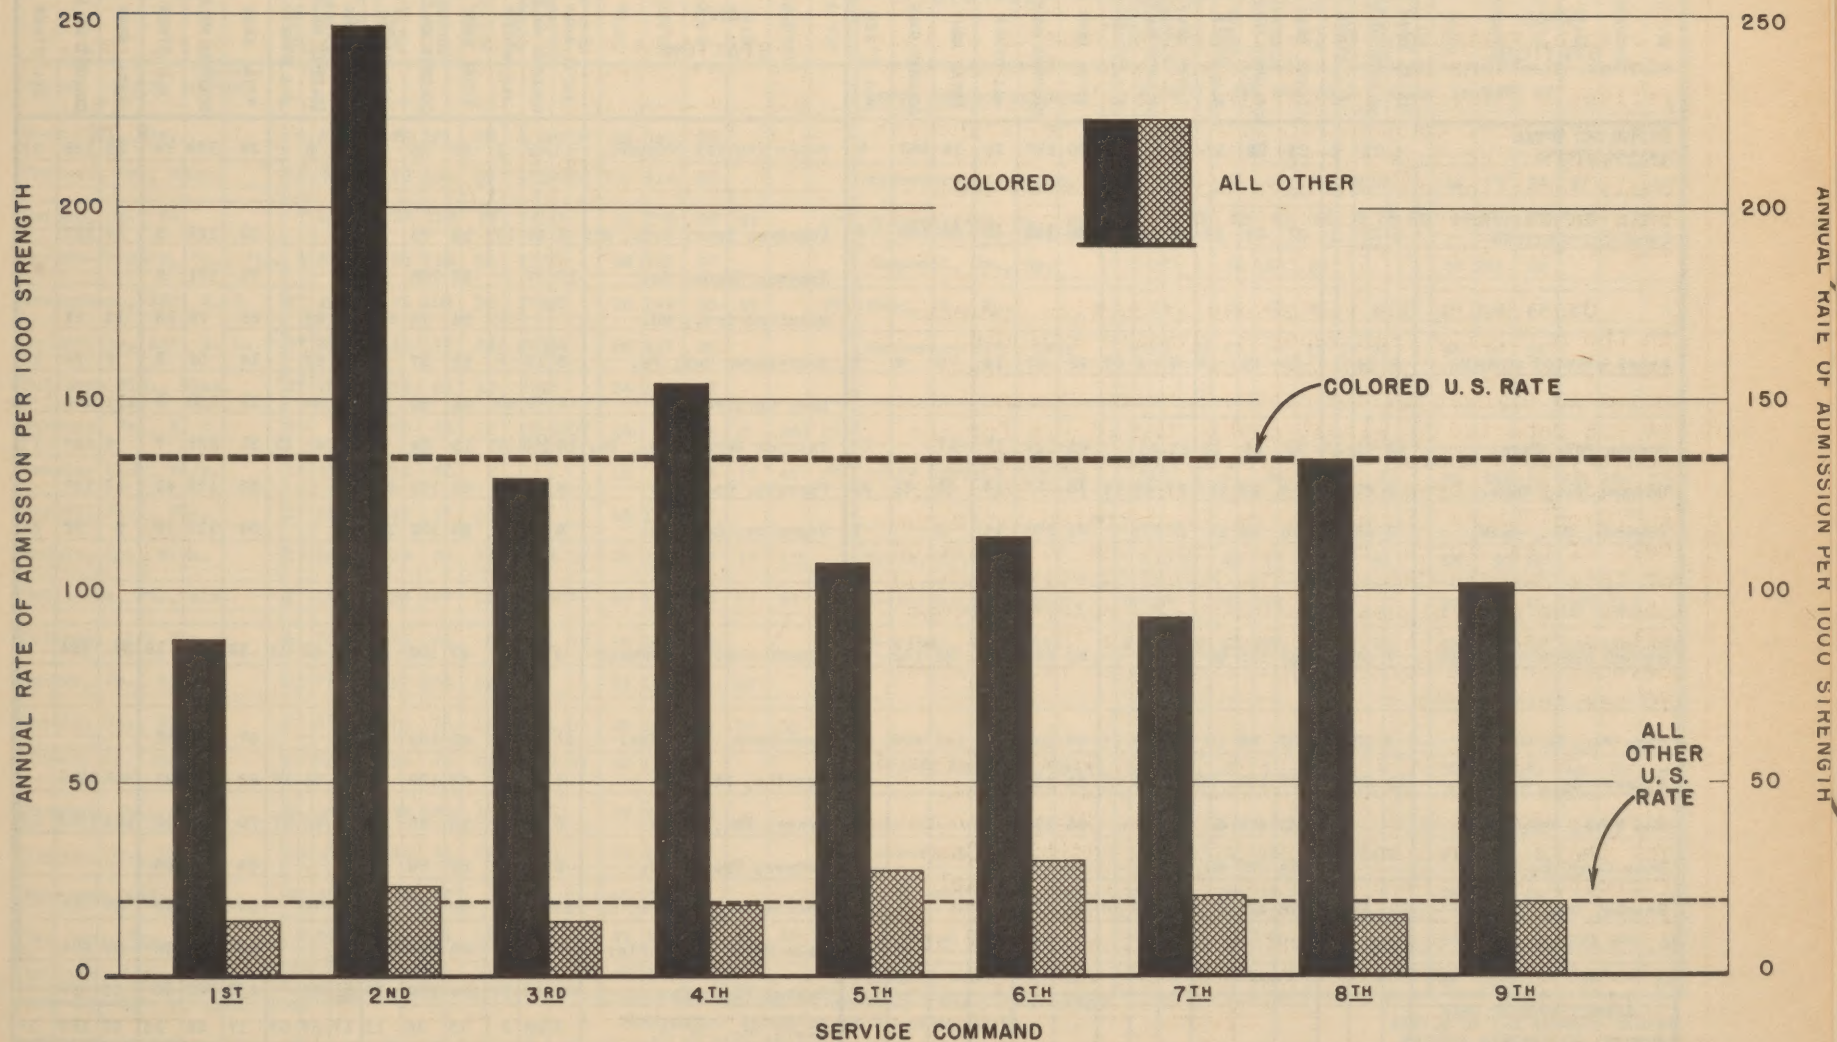

Considering the variations by Service Command in the morbidity from venereal disease excluding EPTS cases, it may be noted that the rate for colored males is highest in the Second Service Command, where it was reported at almost double the figure for the country as a whole. This arises from the high morbidity at three camps (Camp Kilmer, New York PoE, and Camp Shanks) in which are concentrated large numbers of task force troops not under the jurisdiction of this Service Command. The Fourth Service Command shows the next highest morbidity for colored troops with a rate of 154 per thousand, while the First and Seventh Service Commands had the lowest rates (about 90 per thousand).

The three stations in the Second Service Command mentioned above each had morbidity from venereal disease excluding EPTS cases of about 300 per thousand for their colored male strength. In addition Camp Forrest, Tenn., Camp Stoneman, Calif., and Daniel Field, Ga. all had total venereal excluding EPTS rates of 300 or more per thousand. The highest rates of admission for syphilis excluding EPTS cases for

colored males were reported for Camp Forrest, Tenn. (185 per thousand) and Camp Patrick Henry, Va. (108 per thousand). The highest rates for colored males from other venereal diseases excluding EPTS cases were at Camp Kilmer, N.J. (89 per thousand) and Fort Benning, Ga. (76 per thousand).
